

dip (Figure 5a). The inversion of this latest data suggests the source is a single pipe-like body that dips steeply to the NNW (Figure 5b). The Frontier version of C-1 anomaly is located on the northern flank of the magnetic body. The SJV version of C-1 is much larger but lower amplitude. The low chargeability halo essentially envelopes the magnetic anomaly however it has a higher amplitude core that appears to be located along the southern flank.

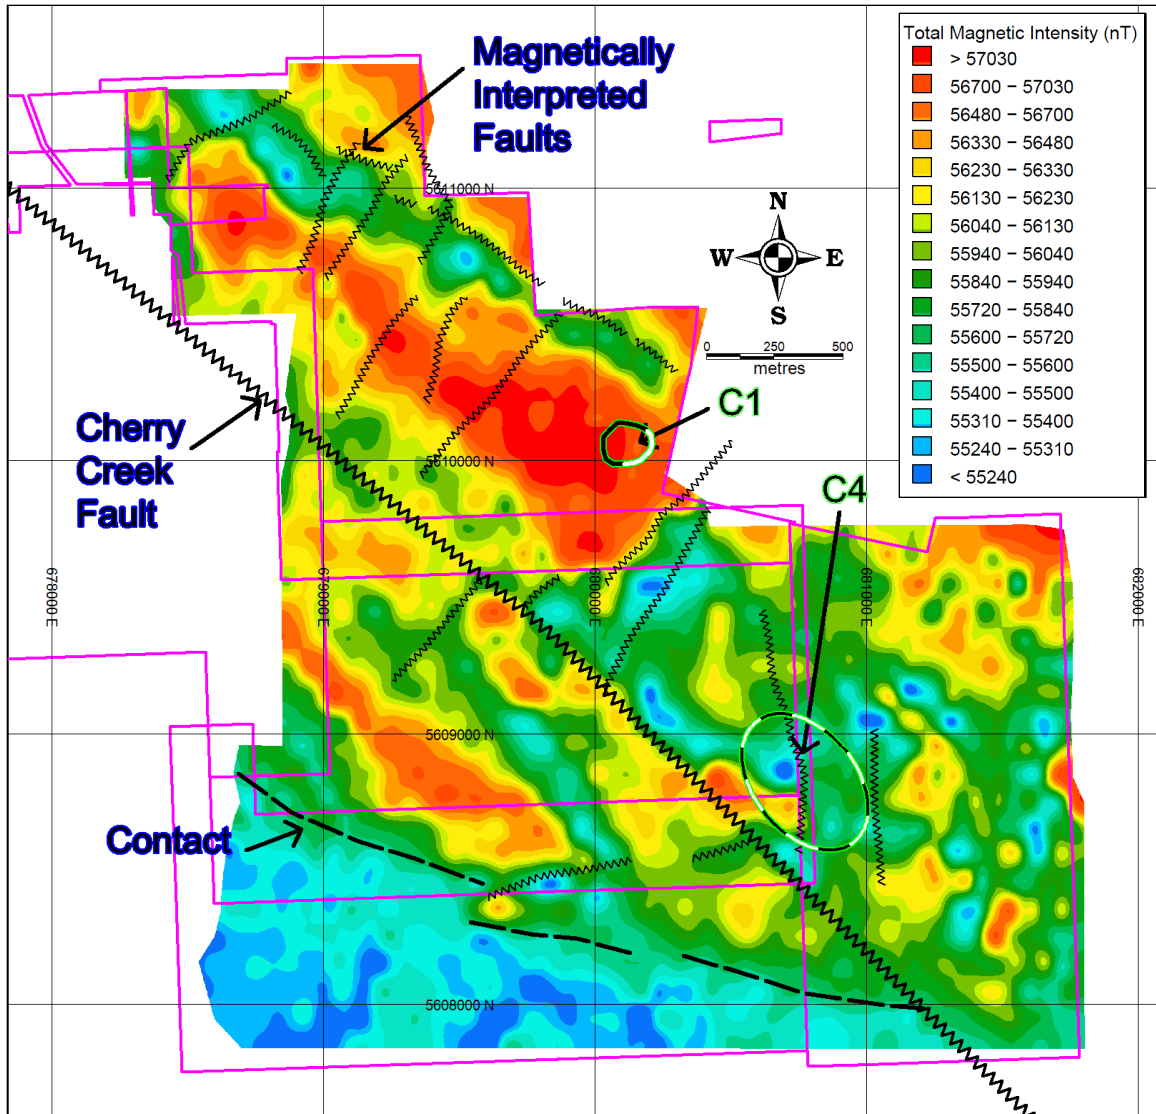

Figure 4: Total magnetic Field Intensity (Plate Mag-3) – interpreted linear features.
